

WHAT IS CLAIMED IS:

1. An external output video signal processor possessing a
video signal processing circuit, which has a latter part processing circuit
5 which inputs a system controller which outputs a video signal, and video
signal output from this system controller, and controls and outputs the
p-p value to a predetermined value, said external output video signal
processor comprises:

said system controller outputs a video signal by which the sync. tip level
10 and the pedestal level were fixed to a predetermined value;
said video signal processing circuit provides with a level shift circuit
which adjusts the level of said video signal input directly from said
system controller; and outputs it to said latter part processing circuit.

15 2. An external output video signal processor according to
Claim 1, which comprises two stages of an inverting amplifier.
